Matlab IC04 Script:

```matlab
% -- ORIGINAL DATA: -------------------------
x1 = [46, 49, 51, 52, 54, 56, 57, 58, 59, 60];
y1 = [40, 50, 55, 63, 72, 70, 77, 73, 90, 93];
deg1 = (length(x1)-1);
rr1 = zeros(1,deg1);
%-------
x2 = [61, 62, 63,  64,  66,  67,  68,  71,  72];
y2 = [96, 88, 99, 110, 113, 120, 127, 137, 132];
deg2 = (length(x2)-1);
rr2 = zeros(1, deg2);
```

Part 1: Use Polyfit to fit the data with several low-order polynomials

Part 2: Plot the Data Set and the Polynomials (x increments by 1) on the Same Graph

Part 3: Compute & Plot the R^2 value as a function of Polynomial Degree

```matlab
% -- FITTED POLYNOMIALS: ---------------------
xx1=min(x1):1:max(x1);
subplot(2,1,1);
figure(1); hold on;
plot(x1, y1, '*', 'DisplayName', 'Original Data Set 1');
for i=1:deg1
    C1 = polyfit(x1, y1, i);
    yy1 = polyval(C1, xx1);
    plot(xx1, yy1, 'DisplayName', sprintf('Data Set 1: Degree %d', i));
    %-- COMPUTE R^2 VALUES: ----------------------
    yy1_err = polyval(C1, x1);
    SST1 = sum((y1-mean(y1)).^2);
    SSE1 = sum((y1-yy1_err).^2);
    rr1(i) = 1- (SST1 / SSE1);
    %fprintf('R-sq. Value for Data Set 1 w/ Degree %d:\n', i);
    %fprintf('R-sq = %f', rr1(i));
end
```

```
Warning: Polynomial is badly conditioned. Add points with distinct X values, reduce the degree of
the polynomial, or try centering and scaling as described in HELP POLYFIT.
